

### What went well

We were able to flesh out more of the frontend and backend architectures and gained a better understanding of best practices within Kotlin and Android development. We were also successful in the implementation of our Google login system using Firebase

### What didn't go well

There was a significant decrease in the amount of communication and work put into this Sprint. A majority of the work and activity shown in the app development has been done by one team member. Also, our daily meetings have lacked participation from team members and we were unable to implement and complete a good amount of stories in our backlog.

### What could be improved

Going forward, team members that have not been as active on the project or that have not contributed as much as others will need to dedicate more time and effort into implementing key features in the app. Communication as a whole will need to be improved as it is key in seeing our idea come to fruition.

### Challenges

Understanding architectures in Kotlin/Android development and which one would be best fit for our app was a challenge.
